

Marmara University, 2021

Probability and Statistics

Subject 2
Describing Data with Numerical Measures

Mujdat Soyuturk, Ph.D.
Associate Professor

Contents

- Describing a Set of Data with Numerical Measures
- Measures of Center
- Measures of Variability
- Standard Deviation
- Measures of Relative Standing
- The Five-Number Summary and Box Plot

Most parts of the slides are derived from the textbook: "Mendenhall, Beaver, Beaver, Introduction to Probability and Statistics, 14th Ed., Brooks/Cole, Cengage Learning, 2013"

2 - 2 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Describing Data with Numerical Measures

- Graphical methods may not always be sufficient for describing data.
 - Doesn't present the "degree of differences".
- Numerical measures (mental pictures)** can be created for both **populations** and **samples**.
 - A **parameter** is a numerical descriptive measure calculated for a population.
 - A **statistic** is a numerical descriptive measure calculated for a sample.

2 - 3 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

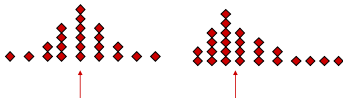

Describing Data with Numerical Measures

- These measures are
 - Measures of Center
 - Measures of Variability (Dispersion)
 - Measures of Relative Standing

2 - 4 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Measures of Center

A measure along the horizontal axis of the data distribution that locates the center of the distribution.

2 - 5 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Arithmetic Mean or Average

The **mean** or **average** of a set of measurements is the sum of the measurements divided by the total number of measurements.

$$\bar{x} = \frac{\sum x_i}{n}$$

where n = number of measurements
 $\sum x_i$ = sum of all the measurements

2 - 6 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

- The set: 2, 9, 11, 5, 6

$$\bar{x} = \frac{\sum x_i}{n} = \frac{2+9+11+5+6}{5} = \frac{33}{5} = 6.6$$

If we were able to enumerate the whole population, the **population mean** would be called μ (the Greek letter "mu").

2 - 7

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Median

- The **median** of a set of measurements is the middle measurement when the measurements are ranked from smallest to largest.
- The **position of the median** is

$$0.5(n + 1)$$

once the measurements have been ordered.

2 - 8

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

- The set: 2, 4, 9, 8, 6, 5, 3 $n = 7$
- Sort: 2, 3, 4, 5, 6, 8, 9
- Position: $0.5(n + 1) = 0.5(7 + 1) = 4^{\text{th}}$

Median = 4th largest measurement

- The set: 2, 4, 9, 8, 6, 5 $n = 6$
- Sort: 2, 4, 5, 6, 8, 9
- Position: $.5(n + 1) = .5(6 + 1) = 3.5^{\text{th}}$

Median = $(5 + 6)/2 = 5.5$ — average of the 3rd and 4th measurements

2 - 9

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Mean vs. Median

- Although both the **mean** and the **median** are good measures of the center of a distribution, the **median** is less sensitive to extreme values or **outliers**.
- When a data stream has extremely small or extremely large observations, the sample mean is drawn toward the direction of extreme measurements.

2 - 10

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Mean vs. Median

- If a distribution *skewed to the right*, the **mean** *shifts to the right*.
- If a distribution *skewed to the left*, the **mean** *shifts to the left*.
- The **median** is not affected by these extreme values.
- When a distribution is **symmetric**, the mean and the median are equal.

2 - 11

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Extreme Values

Symmetric: Mean = Median

Skewed right: Mean > Median

Skewed left: Mean < Median

2 - 12

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Extreme Values

- The mean is more easily affected by extremely large or small values than the median.

- The median is often used as a measure of center when the distribution is skewed.

2 - 13

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Mode

- The **mode** is the measurement which occurs most frequently.
 - The set: 2, 4, 9, 8, 8, 5, 3
 - The mode is **8**, which occurs twice
 - The set: 2, 2, 9, 8, 8, 5, 3
 - There are two modes — **8** and **2** (bimodal)
 - The set: 2, 4, 9, 8, 5, 3
 - There is **no mode** (each value is unique).

2 - 14

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

The number of quarts (U.S. liquid unit equal to 1.136 liters) of milk purchased by 25 households:

0 0 1 1 1 1 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2

- Mean?

$$\bar{x} = \frac{\sum x_i}{n} = \frac{55}{25} = 2.2$$

- Median?

$$m = 2$$

- Mode? (Highest peak)

$$\text{mode} = 2$$

2 - 15

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Measures of Dispersion

Consider the following two sets of integers:

$$S = \{5, 5, 5, 5, 5, 5\} \text{ and } R = \{0, 0, 0, 10, 10, 10\}$$

- If we calculated the mean for both S and R, we will get the number 5 for both.
- However, these are two vastly different data sets. Therefore we need another descriptive statistic besides a measure of central tendency, which we shall call a measure of dispersion or measure of variability.
- We shall measure the dispersion or scatter of the values of our data set about the mean of the data set. If the values tend to be concentrated near the mean, then this measure shall be small, while if the values of the data set tend to be distributed far from the mean, then the measure will be large.
- The two measures of dispersions that are usually used are called the **variance** and **standard deviation**.

2 - 16

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Measures of Variability

A measure along the horizontal axis of the data distribution that describes the **spread** of the distribution from the center.

2 - 17

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

The Range

- The **range, R**, of a set of n measurements is the difference between the largest and smallest measurements.
- Example:** A botanist records the number of petals on 5 flowers:
5, 12, 6, 8, 14
- The range is

$$R = 14 - 5 = 9.$$

- Quick and easy, but only uses 2 of the 5 measurements.
- Doesn't show the relative variability of two sets.

2 - 18

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

The Variance

The **variance** is measure of variability that uses all the measurements.

It measures the average deviation of the measurements about their mean.

Flower petals: **5, 12, 6, 8, 14**

2 - 19

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

The Variance

The **variance of a population** of N measurements is the average of the squared deviations of the measurements about their mean μ .

$$\sigma^2 = \frac{\sum (x_i - \mu)^2}{N}$$

The **variance of a sample** of n measurements is the sum of the squared deviations of the measurements about their mean, divided by $(n - 1)$.

$$s^2 = \frac{\sum (x_i - \bar{x})^2}{n - 1}$$

2 - 20

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

The Standard Deviation

- In calculating the variance, we squared all of the deviations, and in doing so changed the scale of the measurements.
- To return this measure of variability to the original units of measure, we calculate the **standard deviation**, the positive square root of the variance.

Population standard deviation : $\sigma = \sqrt{\sigma^2}$
 Sample standard deviation : $s = \sqrt{s^2}$

2 - 21

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Two Ways to Calculate the Sample Variance

Use the Definition Formula:

x_i	$x_i - \bar{x}$	$(x_i - \bar{x})^2$
5	-4	16
12	3	9
6	-3	9
8	-1	1
14	5	25
Sum	45	60

$$s^2 = \frac{\sum (x_i - \bar{x})^2}{n - 1}$$

$$= \frac{60}{4} = 15$$

$$s = \sqrt{s^2} = \sqrt{15} = 3.87$$

2 - 22

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Two Ways to Calculate the Sample Variance

Use the Computational Formula:

x_i	x_i^2
5	25
12	144
6	36
8	64
14	196
Sum	45 465

$$s^2 = \frac{\sum x_i^2 - \frac{(\sum x_i)^2}{n}}{n - 1}$$

$$= \frac{465 - \frac{45^2}{5}}{4} = 15$$

$$s = \sqrt{s^2} = \sqrt{15} = 3.87$$

2 - 23

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Some Notes

- The value of s is **ALWAYS** positive.
- The larger the value of s^2 or s , the larger the variability of the data set.
- Why divide by $n - 1$?**
 - The sample standard deviation s is often used to estimate the population standard deviation σ . Dividing by $n - 1$ gives us a better estimate of σ .

2 - 24

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Using Measures of Center and Spread: Tchebysheff's Theorem

Given a number k greater than or equal to 1 and a set of n measurements, **at least** $1 - (1/k^2)$ of the measurement will lie within k standard deviations of the mean.

- Can be used for either samples (\bar{x} and s) or for a population (μ and σ).
- Important results:**
 - If $k = 2$, **at least** $1 - 1/2^2 = 3/4$ of the measurements are within 2 standard deviations of the mean.
 - If $k = 3$, **at least** $1 - 1/3^2 = 8/9$ of the measurements are within 3 standard deviations of the mean.

2 - 25

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Using Measures of Center and Spread: Tchebysheff's Theorem

2 - 26

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Using Measures of Center and Spread: The Empirical Rule

Given a distribution of measurements that is approximately mound-shaped:

- ✓The interval $\mu \pm \sigma$ contains approximately 68% of the measurements.
- ✓The interval $\mu \pm 2\sigma$ contains approximately 95% of the measurements.
- ✓The interval $\mu \pm 3\sigma$ contains approximately 99.7% of the measurements.

2 - 27

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

The ages of 50 tenured faculty at a state university.

- 34 48 **70** 63 52 52 35 50 37 43 53 43 52 44
- 42 31 36 48 43 **26** 58 62 49 34 48 53 39 45
- 34 59 34 66 40 59 36 41 35 36 62 34 38 28
- 43 50 30 43 32 44 58 53

$$\bar{x} = 44.9$$

$$s = 10.73$$

Shape? **Skewed right**

2 - 28

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

k	$\bar{x} \pm ks$	Interval	Proportion in Interval	Tchebysheff	Empirical Rule
1	44.9 ± 10.73	34.17 to 55.63	31/50 (.62)	At least 0	<i>≈ .68</i>
2	44.9 ± 21.46	23.44 to 66.36	49/50 (.98)	At least .75	<i>≈ .95</i>
3	44.9 ± 32.19	12.71 to 77.09	50/50 (1.00)	At least .89	<i>≈ .997</i>

• Do the actual proportions in the three intervals agree with those given by Tchebysheff's Theorem?

• Yes. Tchebysheff's Theorem must be true for any data set.

• Do they agree with the Empirical Rule?

• No. Not very well.

• Why or why not?

• The data distribution is not very mound-shaped, but skewed right.

2 - 29

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Using Tchebysheff's Theorem and the Empirical Rule

• Tchebysheff's Theorem

- Applies to any set of measurements; *large or small, mound-shaped or skewed*.
- Always satisfied.
- Gives lower bounds for the given intervals.

• The Empirical Rule

- Is applied only when the data tend to be roughly mound-shaped.
- Rule of thumb
- More accurate estimation

2 - 30

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

The length of time for a worker to complete a specified operation averages 12.8 minutes with a standard deviation of 1.7 minutes.

If the distribution of times is approximately mound-shaped, **Question:** what proportion of workers will take longer than 16.2 minutes to complete the task?

95% between 9.4 and 16.2

47.5% between 12.8 and 16.2

(50-47.5)% = 2.5% above 16.2

2 - 31 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Approximating s

- From **Tchebysheff's Theorem** and the **Empirical Rule**, we know that

$$R \approx 4 - 6s$$

Number of Measurements	Expected Ratio of Range to s
5	2.5
10	3
25	4

- To approximate the standard deviation of a set of measurements, we can use:

$$s \approx R/4$$

or $s \approx R/6$ for a largedata set.

2 - 32 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Approximating s

The ages of 50 tenured faculty at a state university.

• 34 48 **70** 63 52 52 35 50 37 43 53 43 52 44
 • 42 31 36 48 43 **26** 58 62 49 34 48 53 39 45
 • 34 59 34 66 40 59 36 41 35 36 62 34 38 28
 • 43 50 30 43 32 44 58 53

$$R = 70 - 26 = 44$$

$$s \approx R/4 = 44/4 = 11$$

Actual $s = 10.73$

$$s \approx R/4$$

gives only an **approximate** value for s.

2 - 33 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Measures of Relative Standing

- Sometimes we need to know the position of one observation relative to the others in a set of data.
- Where does one particular measurement stand in relation to the other measurements in the data set?
- How many standard deviations away from the mean does the measurement lie? This is measured by the **z-score**.
- z-score** measures the distance between an observation and the mean, measured in units of standard deviation.

$$z\text{-score} = \frac{x - \bar{x}}{s}$$

$x = 9$ lies $z=2$ std dev from the mean.

2 - 34 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Measures of Relative Standing

- The **z-score** is a valuable tool for determining whether a particular observation is **likely to occur quite frequently** or whether **it is unlikely** and might be considered an **outlier**.

2 - 35 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

z-Scores

- From **Tchebysheff's Theorem** and the **Empirical Rule**
 - At least $3/4$ and **more likely 95%** of measurements lie within 2 standard deviations of the mean.
 - At least $8/9$ and **more likely 99.7%** of measurements lie within 3 standard deviations of the mean.
- z-scores between -2 and 2 are not unusual. z-scores should not be more than 3 in absolute value. z-scores larger than 3 in absolute value would indicate a possible **outlier**.

2 - 36 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Measures of Relative Standing

- A percentile is another measure of relative standing and is most often used for large data sets.
- How many measurements lie below the measurement of interest? This is measured by the p^{th} percentile.

2 - 37 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Measures of Relative Standing

- The p^{th} percentile is the value of x that is greater than $p\%$ of the measurements and is less than the remaining $(100-p)\%$.

2 - 38 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Measures of Relative Standing

2 - 39 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Examples

- 90% of all men (16 and older) earn more than \$319 per week.

BUREAU OF LABOR STATISTICS

50 th Percentile	≡ Median
25 th Percentile	≡ Lower Quartile (Q_1)
75 th Percentile	≡ Upper Quartile (Q_3)

2 - 40 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Quartiles and the IQR

2 - 41 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Quartiles and the IQR

- The **lower quartile** (Q_1) is the value of x which is larger than 25% and less than 75% of the ordered measurements.
- The **upper quartile** (Q_3) is the value of x which is larger than 75% and less than 25% of the ordered measurements.
- The range of the "middle 50%" of the measurements is the **interquartile range**,

$$IQR = Q_3 - Q_1$$

2 - 42 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Calculating Sample Quartiles

- The **lower and upper quartiles** (Q_1 and Q_3), can be calculated as follows:
- The **position of Q_1** is

$$.25(n + 1)$$

- The **position of Q_3** is

$$.75(n + 1)$$

once the measurements have been ordered.

If the positions are not integers, find the quartiles by interpolation.

2 - 43

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Calculating Sample Quartiles

interpolation for calculating the quartiles

(if the quartile position is not an integer):

- The lower quartile is taken to be the value of $\frac{3}{4}$ of the distance between the adjacent measurements at the quartile position.
- The upper quartile is taken to be the value of $\frac{1}{4}$ of the distance between the adjacent measurements at the quartile position.
- Example 2.13

2 - 44

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

The prices (\$) of 18 brands of walking shoes:

40 60 65 65 65 68 68 70 70
70 70 70 70 74 75 75 90 95

$$\text{Position of } Q_1 = .25(18 + 1) = 4.75$$

$$\text{Position of } Q_3 = .75(18 + 1) = 14.25$$

✓ Q_1 is $\frac{3}{4}$ of the way between the 4th and 5th ordered measurements, or

$$Q_1 = 65 + .75(65 - 65) = 65.$$

2 - 45

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

The prices (\$) of 18 brands of walking shoes:

40 60 65 65 65 68 68 70 70
70 70 70 70 74 75 75 90 95

$$\text{Position of } Q_1 = .25(18 + 1) = 4.75$$

$$\text{Position of } Q_3 = .75(18 + 1) = 14.25$$

✓ Q_3 is $\frac{1}{4}$ of the way between the 14th and 15th ordered measurements, or

$$Q_3 = 74 + .25(75 - 74) = 74.25$$

✓ and

$$\text{IQR} = Q_3 - Q_1 = 74.25 - 65 = 9.25$$

2 - 46

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Using Measures of Center and Spread: The Box Plot

The Five-Number Summary:

Min	Q_1	Median	Q_3	Max
-----	-------	--------	-------	-----

- **Five-Number Summary** divides the data into 4 sets containing an equal number of measurements. ($\frac{1}{4}$ measurements)

- A quick summary of the data distribution.

- Use to form a **box plot** to describe the **shape** of the distribution and to detect **outliers**.

2 - 47

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Constructing a Box Plot

- Calculate Q_1 , the median, Q_3 and IQR.
- Draw a horizontal line to represent the scale of measurement.
- Draw a box using Q_1 , the median, Q_3 .

2 - 48

Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Constructing a Box Plot

- iv. Isolate outliers by calculating
- **Lower fence:** $Q_1 - 1.5 \text{ IQR}$
 - **Upper fence:** $Q_3 + 1.5 \text{ IQR}$
- v. Measurements beyond the upper or lower fence are **outliers** and are marked (*).

2 - 49 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Constructing a Box Plot

- vi. Draw "**whiskers**" connecting the largest and smallest measurements that are NOT outliers to the box.

2 - 50 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Box Plot

2 - 51 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

Amount of sodium in 8 brands of cheese:

260 290 300 320 330 340 340 520

$Q_1 = 297.5$ $m = 325$ $Q_3 = 340$

2 - 52 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Example

$$\text{IQR} = 340 - 297.5 = 42.5$$

$$\text{Lower fence} = 297.5 - 1.5(42.5) = 233.75$$

$$\text{Upper fence} = 340 + 1.5(42.5) = 403.75$$

Outlier: $x = 520$

2 - 53 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Interpreting Box Plots

- Median line in center of box and whiskers of equal length — symmetric distribution
- Median line left of center and long right whisker — skewed right
- Median line right of center and long left whisker — skewed left

2 - 54 Mujdat Soyuturk, Probability and Statistics, Spring 2021, Marmara University

Key Concepts

I. Measures of Center

1. Arithmetic mean (mean) or average

a. Population: μ

$$\bar{x} = \frac{\sum x_i}{n}$$

b. Sample of size n :

2. Median: **position** of the median = $.5(n+1)$

3. Mode

4. The median may be preferred to the mean if the data are highly skewed.

II. Measures of Variability

1. Range: $R = \text{largest} - \text{smallest}$

2 - 55 Mıjdat Soyıurk, Probability and Statistics, Spring 2021, Marmara University

Key Concepts

2. Variance

a. Population of N measurements:

$$\sigma^2 = \frac{\sum (x_i - \mu)^2}{N}$$

b. Sample of n measurements:

$$s^2 = \frac{\sum (x_i - \bar{x})^2}{n-1} = \frac{\sum x_i^2 - \frac{(\sum x_i)^2}{n}}{n-1}$$

3. Standard deviation

Population standard deviation : $\sigma = \sqrt{\sigma^2}$

Sample standard deviation : $s = \sqrt{s^2}$

4. A rough approximation for s can be calculated as $s \approx R/4$.
The divisor can be adjusted depending on the sample size.

2 - 56 Mıjdat Soyıurk, Probability and Statistics, Spring 2021, Marmara University

Key Concepts

III. Tchebysheff's Theorem and the Empirical Rule

1. Use Tchebysheff's Theorem for any data set, regardless of its shape or size.

a. At least $1-(1/k^2)$ of the measurements lie within k standard deviation of the mean.

b. This is only a lower bound; there may be more measurements in the interval.

2. The Empirical Rule can be used only for relatively mound-shaped data sets.

– Approximately 68%, 95%, and 99.7% of the measurements are within one, two, and three standard deviations of the mean, respectively.

2 - 57 Mıjdat Soyıurk, Probability and Statistics, Spring 2021, Marmara University

Key Concepts

IV. Measures of Relative Standing

1. Sample z-score:

2. p th percentile; $p\%$ of the measurements are smaller, and $(100-p)\%$ are larger.

3. Lower quartile, Q_1 ; **position** of $Q_1 = .25(n+1)$

4. Upper quartile, Q_3 ; **position** of $Q_3 = .75(n+1)$

5. Interquartile range: $IQR = Q_3 - Q_1$

V. Box Plots

1. Box plots are used for detecting outliers and shapes of distributions.

2. Q_1 and Q_3 form the ends of the box. The median line is in the interior of the box.

2 - 58 Mıjdat Soyıurk, Probability and Statistics, Spring 2021, Marmara University

Key Concepts

3. Upper and lower fences are used to find outliers.

a. **Lower fence:** $Q_1 - 1.5(IQR)$

b. **Upper fence:** $Q_3 + 1.5(IQR)$

4. **Whiskers** are connected to the smallest and largest measurements that are not outliers.

5. Skewed distributions usually have a long whisker in the direction of the skewness, and the median line is drawn away from the direction of the skewness.

2 - 59 Mıjdat Soyıurk, Probability and Statistics, Spring 2021, Marmara University
