

3.6 The Chain Rule

THEOREM -The Chain Rule If $f(u)$ is differentiable at the point $u = g(x)$ and $g(x)$ is differentiable at x , then the composite function $(f \circ g)(x) = f(g(x))$ is differentiable at x , and

$$(f \circ g)'(x) = f'(g(x)) \cdot g'(x).$$

In Leibniz's notation, if $y = f(u)$ and $u = g(x)$, then

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$$

where dy/du is evaluated at $u = g(x)$.

Ex $y = 3u - 9$, $u = \frac{1}{2}x^4$

$$\begin{aligned}\frac{dy}{dx} &= \frac{dy}{du} \cdot \frac{du}{dx} \\ &= 3 \cdot \frac{4}{2}x^3 = 6x^3\end{aligned}$$

Ex $y = \cos u$, $u = \sin x \Rightarrow \frac{dy}{dx} = \frac{dy}{du} \frac{du}{dx} = -\sin(\sin x) \cos x$

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} \quad \frac{dy}{du} = -\sin u, \quad \frac{du}{dx} = \cos x$$

$$\text{Ex } y = 2u^3, \quad u = 8x - 1$$

$$\frac{dy}{du} = 6u^2, \quad \frac{du}{dx} = 8$$

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx}$$

$$= 6u^2 \cdot 8 = 48(8x - 1)^2$$

$$\text{Ex } y = \tan(\underbrace{10x - 5}_u), \quad u = 10x - 5$$

$$y = \tan u$$

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = \sec^2 u \cdot 10 = 10 \sec^2(10x - 5)$$

$$\text{Ex } y = \cos\left(-\frac{x}{3}\right), \quad u = -x/3$$

$$y = \cos u$$

$$\begin{aligned} \frac{dy}{dx} &= \frac{dy}{du} \cdot \frac{du}{dx} = -\sin u \cdot (-1/3) \\ &= \frac{1}{3} \sin(-x/3) \end{aligned}$$

Ex $y = -\sec(x^2 + 7x)$, $u = x^2 + 7x$

$$y = -\sec u$$

$$\frac{dy}{dx} = \frac{dy}{du} \frac{du}{dx}$$

$$= -\sec u \tan u \cdot (2x + 7)$$

$$= -(2x + 7) \sec(x^2 + 7x) \tan(x^2 + 7x)$$

Ex $y = \sqrt{3x^2 - 4x + 6}$ $u = 3x^2 - 4x + 6$

$$y = u^{1/2} \quad \frac{dy}{du} = \frac{1}{2} u^{-1/2} \quad \frac{du}{dx} = 6x - 4$$

$$\frac{dy}{dx} = \frac{dy}{du} \frac{du}{dx} = -\frac{1}{2\sqrt{u}} \cdot (6x - 4)$$

$$= \frac{3x - 2}{\sqrt{3x^2 - 4x + 6}}$$

$$\text{Ex } y = \sin^3 x = (\sin x)^3 \quad u = \sin x$$

$$y = u^3, \quad \frac{dy}{du} = 3u^2 \quad \frac{du}{dx} = \cos x$$

$$\frac{dy}{dx} = \frac{dy}{du} \frac{du}{dx} = 3u^2 \cos x = 3(\sin x)^2 \cos x = 3\sin^2 x \cos x$$

$$\text{Ex } y = \sec(\tan x) \quad u = \tan x, \quad \frac{du}{dx} = \sec^2 x$$

$$y = \sec u \quad \frac{dy}{du} = \sec u \tan u = \sec(\tan x) \tan(\tan x)$$

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = \sec(\tan x) \cdot \tan(\tan x) \cdot \sec^2 x$$

$$\text{Ex } y = 5 \cos^3 x = 5(\cos x)^3 \quad u = \cos x$$

$$y = 5u^3, \quad \frac{dy}{du} = 15u^2$$

$$\frac{du}{dx} = -\sin x$$

$$\frac{dy}{dx} = \frac{dy}{du} \cdot \frac{du}{dx} = 15u^2 \cdot (-\sin x) = -15 \cos^2 x \sin x$$

$$\text{Ex } y = \sin^3 x + 3 \sin x^3$$

$$\begin{aligned} y' &= 3 \sin^2 x \cdot 3 \cos x + 3 \cos x^3 \cdot 3x^2 \\ &= 9 \sin^2 x \cos x + 9x^2 \cos x^3 \end{aligned}$$

$$\text{Ex } y = \sin(\cos x) \rightarrow y' = \cos(\cos x) \cdot (-\sin x)$$

$$y' = -\sin x \cos(\cos x)$$

$$\text{Ex } y = \left(\frac{x^2+1}{x^3+2x} \right)^4 \quad u = \frac{x^2+1}{x^3+2x}$$

$$y' = \frac{dy}{du} \cdot \frac{du}{dx} = 4 \left(\frac{x^2+1}{x^3+2x} \right)^3 \cdot \frac{d}{dx} \left(\frac{x^2+1}{x^3+2x} \right)$$

$$\text{Ex } y = \sqrt[m]{x} \quad m \text{ is an integer}$$

$$y = x^{\frac{1}{m}} \Rightarrow y' = \frac{1}{m} x^{\frac{1}{m}-1}$$

$$\begin{aligned} \text{Ex } \frac{d}{dx} \sqrt[3]{x^3 - 2x + 1} &= \frac{1}{3} (x^3 - 2x + 1)^{\frac{1}{3} - 1} \cdot \frac{d}{dx} (x^3 - 2x + 1) \\ &= \frac{1}{3} (x^3 - 2x + 1)^{-\frac{2}{3}} (3x^2 - 2) \end{aligned}$$

$$\text{Ex } y = 4 \sin(\sqrt{1 + \sqrt{t}})$$

$$\begin{aligned} \frac{dy}{dt} &= 4 \cos(\sqrt{1 + \sqrt{t}}) \cdot \frac{1}{2} (1 + \sqrt{t})^{-\frac{1}{2}} \cdot \frac{1}{2} t^{-\frac{1}{2}} \\ &= \frac{\cos \sqrt{1 + \sqrt{t}}}{\sqrt{t + t\sqrt{t}}} \end{aligned}$$

$$\text{Ex if } f'(x) = \sqrt{3x^2 - 1} \text{ and } y = f(x^2), \quad u = x^2$$

$$\text{Find } \frac{dy}{dx} \quad x \rightarrow u \rightarrow y$$

$$\begin{aligned} \frac{dy}{dx} &= \frac{dy}{du} \cdot \frac{du}{dx} \\ &= f'(x^2) \cdot 2x = \sqrt{3x^4 - 1} \cdot 2x \end{aligned}$$

$$\text{Ex } f(x) = \sqrt{7 + x \sec x}$$

$$u = 7 + x \sec x$$

$$\frac{du}{dx} = \sec x + x \sec x \tan x$$

$$y = u^{1/2}, \quad \frac{dy}{du} = \frac{1}{2\sqrt{u}} = \frac{1}{2\sqrt{7 + x \sec x}}$$

$$\begin{aligned} \frac{dy}{dx} &= \frac{dy}{du} \cdot \frac{du}{dx} \\ &= \frac{\sec x + x \sec x \tan x}{2\sqrt{7 + x \sec x}} \end{aligned}$$
